PRODUCT PERFORMANCE

DS1-12 Cooler Performance

Pressure drop with ISO VG 46 oil at 10 gpm is less than 5 psig.
Performance is based on 85 F ETD.

DETERMINE THE HEAT LOAD

The Performance Curves are Based on the Following:

- 50 SUS Oil
- 50 °F Entering Temperature Difference (ETD)

If your application conditions are different, use the following selection procedure:

STEP 1: Determine the Heat Load

In most cases you can use 1/3 of the input horsepower.
Example: 30 HP Power Unit = 10 HP Heat Load

STEP 2: Determine the Actual ETD Desired

Entering **OIL** Temperature - Entering **AIR** Temperature = **ETD**. The Entering oil temperature is the highest desired oil temperature. The entering air temperature is the highest anticipated ambient air temperature, plus any pre-heating of the air prior to it entering the cooler.

STEP 3: Calculate the Adjusted Btu/Hr for Selection

$$\text{Horsepower} \times \frac{85}{\text{Desired ETD}} = \text{Horsepower For Use With Selection Chart}$$

STEP 4: Select the Model from the Curves

Read up from the GPM to the required heat rejection.
Select any model on, or above this point.
